ABSTRACT OF THE DISCLOSURE

A data reproducing apparatus starts replaying a disk from a logical sector number "2180h", which is searched for by a partition acquiring unit 13, and acquires the logical block numbers "A8h" and "ABh" of file entries (i.e., "VR_MANGAR.IFO" and "VR_MOVIE.VRO" file entries). Therefore, the data reproducing apparatus can identify the position of a file without changing the standard to which the file system of the disk conforms even if there occurs a data loss in the management information about the file.
